## Sommario/riassunto

From wide-ranging overviews of the entire region to close readings of specific works, this volume opens a fascinating window on the literatures and cultures of the Caribbean, covering texts in the multiplicity of languages used in the wider Caribbean: Spanish, English, French, Dutch, Portuguese, and the region's many creoles. Authors and works discussed range from luminaries such as Derek Walcott to hitherto practically unknown works in Antillean creole languages. Underlying is the idea to foster the study of the Caribbean literary, artistic and visual text through a comparative lens, a firm proposal to think beyond the persisting linguistic barriers and scholarly divides in the field. As such, *Caribbeing: Comparing Caribbean Literatures and Cultures* brings a new approach to the Caribbean embracing the region's linguistic multiplicity and complexity without eschewing the many theoretical challenges and obstacles such a scholarly endeavor entails. Because of its ample scope this book will appeal to scholars and students working on the Caribbean and Latin America, but also to those interested in the broader fields of postcolonial and cultural studies.

## Sommario/riassunto

We are rapidly heading towards a world in which the computing infrastructure will contain billions of devices, which will interact with other computing/communications devices that are carried or worn by users as they go through their daily routines. Such devices will provide data access to mobile users as they move within buildings, cities, or across the globe. This new infrastructure presents tremendous challenges for data management technology, including: huge scale; variable and intermittent connectivity; location and context-aware applications; bandwidth, power, and device size limitations; and multimedia data delivery across hybrid networks and systems. Traditional data management technologies such as query processing, transaction management, workflow, business process management, and metadata management must all be reevaluated in this emerging environment. Furthermore, nontraditional issues such as the semantics of mobile data, location-dependent querying, broadcast and multicast delivery, and caching/prefetching techniques must all be addressed. The ability to track people as they move about their daily tasks raises serious issues of security and privacy. This conference is the fourth in the Mobile Data Management series, focusing on the challenges and opportunities for the management of data in mobile, pervasive, and wearable computing. MDM 2000 and 2001 were in Hong Kong and

MDM 2002 was in Singapore. Eighty-seven papers were submitted to the conference from 23 countries and were subject to a rigorous review procedure. Every paper had three or four independent reviews. Twenty-one full papers and 15 short papers from both academia and industry were selected for publication in this volume of proceedings.
