3. **Record Nr.** UNINA9910346661203321
- Autore** Martínez-Gómez Pedro
- Titolo** Plant Genetics and Molecular Breeding / Pedro Martínez-Gómez
- Pubbl/distr/stampa** MDPI - Multidisciplinary Digital Publishing Institute, 2019  
Basel, Switzerland : , : MDPI, , 2019
- ISBN** 9783039211760  
3039211765
- Descrizione fisica** 1 electronic resource (628 p.)
- Soggetti** Biology, life sciences
- Lingua di pubblicazione** Inglese
- Formato** Materiale a stampa
- Livello bibliografico** Monografia
- Sommario/riassunto** The development of new plant varieties is a long and tedious process involving the generation of large seedling populations for the selection of the best individuals. While the ability of breeders to generate large populations is almost unlimited, the selection of these seedlings is the main factor limiting the generation of new cultivars. Molecular studies for the development of marker-assisted selection (MAS) strategies are particularly useful when the evaluation of the character is expensive, time-consuming, or with long juvenile periods. The papers published in the Special Issue "Plant Genetics and Molecular Breeding" report highly novel results and testable new models for the integrative analysis of genetic (phenotyping and transmission of agronomic characters), physiology (flowering, ripening, organ development), genomic (DNA regions responsible for the different agronomic characters), transcriptomic (gene expression analysis of the characters), proteomic

(proteins and enzymes involved in the expression of the characters), metabolomic (secondary metabolites), and epigenetic (DNA methylation and histone modifications) approaches for the development of new MAS strategies. These molecular approaches together with an increasingly accurate phenotyping will facilitate the breeding of new climate-resilient varieties resistant to abiotic and biotic stress, with suitable productivity and quality, to extend the adaptation and viability of the current varieties.
