|--------------------|---|
| Sommario/riassunto | Maintaining a stable level of power quality in the distribution network is<br>a growing challenge due to increased use of power electronics<br>converters in domestic, commercial and industrial sectors. Power<br>quality deterioration is manifested in increased losses; poor utilization<br>of distribution systems; mal-operation of sensitive equipment and<br>disturbances to nearby consumers, protective devices, and<br>communication systems. However, as the energy-saving benefits will<br>result in increased AC power processed through power electronics<br>converters, there is a compelling need for improved understanding o   |
