Sommario/riassunto	European countries are currently involved in several irregular migration systems, resulting in undocumented populations estimated at several millions. They manage to live and work for years without a certified identity - a phenomenon that challenges existing notions of political statehood and societal membership. Drawing on empirical studies carried out in a variety of settings, the authors of this illuminating study analyse the ways in which such irregular migration systems developed over time, interacting with changes in European labour markets, welfare regimes and immigration policies.

<b>Sommario/riassunto</b>	This book characterizes the technical and social aspects of engineering practice and to look at ways that this characterization can be important in the design of engineering courses in higher education. The principal

contours of the work include the study of engineering practice and its relation to knowledge, competences and to cross-disciplinary and identity contexts. Empirical data on the practice of engineering professionals are presented from a range of companies in different national contexts, including engineering design companies and engineering innovation leaders--
