### Sommario/riassunto

The classic reference on the synthesis of medicinal agents --now completely updated The seventh volume in the definitive series that provides a quick yet thorough overview of the synthetic routes used to access specific classes of therapeutic agents, this volume covers approximately 220 new non-proprietary drug entities introduced since the publication of Volume 6. Many of these compounds represent novel structural types first identified by sophisticated new cell-based assays. Specifically, a significant number of new antineoplastic and antiviral agents are covered.
