Sommario/riassunto

The acoustic properties associated with prominence (e.g. duration, F0) may also serve for "phonemic" contrasts. The question is thus how speakers correctly interpret these properties. We address this question in terms of an extension of the Functional Load Hypothesis (FLH): given that vowel length is contrastive in Hungarian, the FLH predicts that duration will not be the main cue to prominence (i.e. stress or focus). Based on a large, systematically collected corpus, we demonstrate that this is, in fact, the case; the main cue for both is pitch (F0), though its characteristics are different i

Sommario/riassunto	A Brookings Institution Press and American Enterprise Institute publication There is widespread concern in the telecommunications

industry that public policy may be impeding the continued development of the Internet into a high-speed communications network. In the absence of ubiquitous, high-speed "broadband" Internet connections for residential and small-business customers, the demand for IT equipment and new Internet service applications may stagnate. Broadband policy is controversial in large part because of the differences in the regulatory regimes faced by different types of carriers. C
