Sommario/riassunto	This open access book serves as textbook on the physics of the radiation belts surrounding the Earth. Discovered in 1958 the famous Van Allen Radiation belts were among the first scientific discoveries of the Space Age. Throughout the following decades the belts have been under intensive investigation motivated by the risks of radiation hazards they expose to electronics and humans on spacecraft in the Earth's inner magnetosphere. This textbook teaches the field from basic theory of particles and plasmas to observations which culminated in the highly successful Van Allen Probes Mission of NASA in 2012-2019. Using numerous data examples the authors explain the relevant concepts and theoretical background of the extremely complex radiation belt region, with the emphasis on giving a comprehensive and coherent understanding of physical processes affecting the dynamics of the belts. The target audience are doctoral students and young researchers who wish to learn about the physical processes underlying the acceleration, transport and loss of the radiation belt particles in the perspective of the state-of-the-art observations.

### Sommario/riassunto

This volume surveys the interplay between state and non-state actors in Latin American foreign policies and attitudes towards the Middle East in the twenty-first century. How will domestic instability and international tensions affect the choices and behavior of Latin American countries towards the Arab world? The chapters here offer insight into this and similar questions, as well as a comparative value in analyzing countries beyond those specifically discussed. Common topics in policy making are considered—namely, Israel and Palestine, Iran, the Gulf countries, and the Arab "Spring"—as authors from distinct disciplines examine the crucial relation between ends and means on the one hand, and foreign policy actions and context on the other.
