Formato	Materiale a stampa
Livello bibliografico	Monografia
Sommario/riassunto	The book is intended for psychologists and researchers working with the projective method. The intention is to present the possibilities of diagnosing interpersonal adaptation and self-perception. The main part is devoted to a study based on the experience of the authors of the book with the Rorschach method as well as the existing significant approaches to scoring and interpretation of human movement determinants in the works of H. Rorschach, E. Bohm, Z. Piotrowski and others. The interpretation possibilities of the determinant for different clinical groups, alexithymia, prediction of successful adaptation and managerial performance are presented. In the study itself, the relationships of the determinant and 33 qualitative categories were verified in relation to the results of other diagnostic methods. The publication provides inspiration and practical implications for psychological research and diagnostic practice.
