Sommario/riassunto	Someone was stalking her. Now he's found her... When artist Katie Summers emerged from a four-day coma, she remembered all too vividly the horror of that night - the terrifying dead eyes that had stared back at her in the rear view mirror, causing her to crash her car. But nobody believed her. Even the enigmatic and disturbingly attractive psychiatrist, Dr. Jonathan Shea, implied that she had made the whole thing up. Or dreamed it.

Sommario/riassunto	In the food industry, scientists are exploring the potential of nanotechnology to enhance the flavor and other sensory characteristics of foods, introduce antibacterial nanostructures into food packaging and encapsulate and deliver nutrients directly into targeted tissues, among other applications. However, as with any new technology, along with the benefits, there is the potential for unanticipated adverse effects. There is still a great deal to learn about any health outcomes related to introducing nanosized materials into foods and food packaging materials. Developing nanotechnology into a safe, effective tool for use in food science and technology will require addressing these and other questions. Assuring consumer confidence will be equally important to the success of this new emerging technology. The

Institute of Medicine held a one-day workshop, summarized in this volume, to further explore the use of nanotechnology in food. Specifically, the workshop was organized around three primary topic areas: (1) the application of nanotechnology to food products; (2) the safety and efficacy of nanomaterials in food products; and (3) educating and informing consumers about the applications of nanotechnology to food products.
