Sommario/riassunto

This book details an approach for realization of the field decomposition concept. The book presents the methods as well as techniques and procedures for establishing electric machine circuit-loops and determining their parameters. The methods developed have been realized using the models of machines with laminated and solid rotor having classical structure. The use of such models are well recognized and simplifies practical implementation of the obtained results. This book also:

- Includes methods for a construction of electric machine equivalent circuits that allows the replacement of the field models of the machine with simple circuit models
- Demonstrates the practical implementation of the proposed techniques and procedures
- Presents parameters of the circuit-loops in the form most convenient for practical implementation
- Uses methods based on machine models widely used in practice.
