Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Sommario/riassunto	Lapita comprises an archaeological horizon that is fundamental to the understanding of human colonisation and settlement of the Pacific as it is associated with the arrival of the common ancestors of the Polynesians and many Austronesian-speaking Melanesians more than 3000 years ago. While Lapita archaeology has captured the imagination and sustained the focus of archaeologists for more than 50 years, more recent discoveries have inspired renewed interpretations and assessments. Oceanic Explorations reports on a number of these latest discoveries and includes papers which reassess the Lapita phenomenon in light of this new data. They reflect on a broad range of interrelated themes including Lapita chronology, patterns of settlement, migration, interaction and exchange, ritual behaviour, sampling strategies and ceramic analyses, all of which relate to aspects highlighting both

advances and continuing impediments associated with Lapita research.

Nota di contenuto	Theory: What is migraine? -- Myths and Misperception -- Pathophysiology of migraine -- History of migraine surgery -- How does migraine surgery work?. Current scientific evidence -- Interdisciplinary approach. Practice: Course of treatment -- Patient selection -- The Botox test -- PREEMPT vs Decompression -- The surgery (nose, temple, neck, forehead) -- Follow-up -- Controversy -- Perspective. .
Sommario/riassunto	Migraine surgery is the only existing treatment option that can lead to a permanent symptomatic improvement. Surgical techniques and advances in the understanding of the underlying mechanisms are evolving rapidly. This book intends to familiarise surgeons with the concept of migraine headaches and explains the surgical deactivation of trigger sites, which consists of much more than the decompression of pericranial nerves. The traditional notion of the brain as the sole

origin of migraine is supplanted by a concept where the alteration of afferent signals in conjunction with peripheral and central sensitization can trigger a migraine attack. Migraine surgery targets the crucial role of extracranial tissues in the genesis of migraine which is corroborated by substantial clinical, anatomical and pathophysiological evidence.
