Sommario/riassunto	This handbook offers timely investigation of current pharmaceutical trends, clinical guidelines, novel treatments, and ongoing pipeline developments, including ground-breaking advances in the use of novel oral anticoagulants. Atrial fibrillation (AF) affects an estimated 1–2% of the population and is the most common cause of sustained cardiac arrhythmia. Critically, the number of patients developing AF is expected to double in the next five decades, leading to increased incidence of

stroke, heart failure and other serious thromboembolic events.
