

1. Record Nr.	UNINA9910300388203321
Autore	Srinivasan Ganesan
Titolo	Life and Death of the Stars // by Ganesan Srinivasan
Pubbl/distr/stampa	Berlin, Heidelberg : , : Springer Berlin Heidelberg : , : Imprint : Springer, , 2014
ISBN	3-642-45384-8
Edizione	[1st ed. 2014.]
Descrizione fisica	1 online resource (XVII, 225 p. 113 illus.)
Collana	Undergraduate Lecture Notes in Physics, , 2192-4791
Classificazione	520 US 4000
Disciplina	523.88
Soggetti	Astrophysics Observations, Astronomical Astronomy—Observations Astrophysics and Astroparticles Astronomy, Observations and Techniques
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Bibliographic Level Mode of Issuance: Monograph
Nota di contenuto	Part I: A Historical Perspective -- What Are the Stars? -- Stars in Their Youth -- White Dwarf Stars -- The Principles of Statistical Mechanics -- Fermi–Dirac Distribution -- Quantum Stars -- The Chandrasekhar Limit -- The Absurd Behaviour of Stars: Not All Stars Will Have Energy to Cool -- Guest Stars -- Supernovae, Neutron Stars and Black Holes -- A Profile of Chandra -- Part II: The Life History of Stars—A Modern Perspective -- To Burn or Not To Burn -- What Does the Future Hold for the Sun? -- Life History of Intermediate Mass Stars -- Diamonds in the Sky -- Exploding Stars.
Sommario/riassunto	This volume is devoted to one of the fascinating things about stars: how they evolve as they age. This evolution is different for stars of different masses. How stars end their lives when their supply of energy is exhausted also depends on their masses. Interestingly, astronomers conjectured about the ultimate fate of the stars even before the details of their evolution became clear. Part I of this book gives an account of the remarkable predictions made during the 1920s and 1930s concerning the ultimate fate of stars. Since much of this development hinged on quantum physics that emerged during this time, a detailed

introduction to the relevant physics is included in the book. Part II is a summary of the life history of stars. This discussion is divided into three parts: low-mass stars, like our Sun, intermediate-mass stars, and massive stars. Many of the concepts of contemporary astrophysics were built on the foundation erected by Subrahmanyan Chandrasekhar in the 1930s. This book, written during his birth centenary, includes a brief biographical sketch of the brilliant scientist, which readers will find fascinating. Reading this book will get young students excited about the presently unfolding revolution in astronomy and the challenges that await them in the world of physics, engineering and technology. General readers will also find the book appealing for its highly accessible narrative of the physics of stars. This book is a companion volume of "What are the Stars?" by the same author. "I know of no other book on the evolution of stars of a similar scope and breadth that is so accessible for undergraduate students." E P J van den Heuvel Professor of Astrophysics Winner of the Spinoza and Descartes Prizes University of Amsterdam, The Netherlands .
