

1. Record Nr.	UNINA9910349377703321
Titolo	Thrombosis and Hemostasis in Cancer // edited by Gerald Soff
Pubbl/distr/stampa	Cham : , : Springer International Publishing : , : Imprint : Springer, , 2019
ISBN	3-030-20315-8
Edizione	[1st ed. 2019.]
Descrizione fisica	1 online resource (211 pages)
Collana	Cancer Treatment and Research, , 0927-3042 ; ; 179
Disciplina	616.157 616.15
Soggetti	Oncology Hematology Cancer research Oncology Cancer Research
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Nota di contenuto	Thrombosis and Hemostasis in Cancer. Scope of the Problem and Overview -- Pathophysiology 1. Mechanisms of Thrombosis in Cancer Patients -- Pathophysiology 3. The role of platelets in cancer biology -- The risk of thrombosis in cancer. Clinical factors & possible role of primary prophylaxis -- Biomarkers of cancer-associated thromboembolism -- Thrombotic Risk from Chemotherapy and Other Cancer Therapies -- Treatment of VTE In Cancer. Historical Perspective and evolving role of the DOACs -- Etiology and Management of Upper Extremity, Central line associated thrombosis -- Management of Thrombocytopenia In Cancer Patients -- Microangiopathy in Cancer. Causes, Consequences, and Management -- Thrombosis in the Philadelphia chromosome-negative Myeloproliferative Neoplasms -- Anticoagulation in the setting of primary and metastatic brain tumors -- Hemorrhage in the cancer patient. APML and other specific high risk situations.
Sommario/riassunto	In this book, leaders in the field explore our current understanding of thrombosis and hemostasis in cancer and address key questions on the subject. Among the topics discussed are the mechanisms that cancers

use to activate the coagulation system, and those by means of which an activated coagulation system can lead to more aggressive cancer growth. Clinical chapters examine the role of thrombosis prophylaxis and treatment, central line-associated thrombosis, and cancer-associated hemorrhage. Subsequent chapters deal with the management of chemotherapy-induced thrombocytopenia, anticoagulation in the presence of brain metastases, and other unique challenges in the interaction of thrombosis and hemostasis in cancer. It has been 150 years since Armand Trousseau first described the well-known association between cancer and an increased risk of thrombosis, which may be considered the first paraneoplastic syndrome ever identified. More recently, numerous studies have indicated that activation of the coagulation system by cancer not only increases the likelihood of thrombosis, but is also associated with a more aggressive cancer phenotype. By familiarizing readers with the latest developments in this complex and challenging field, the book offers a valuable resource for scientists and clinicians alike. .
