1.	Record Nr.	UNINA9910349512903321
	Autore	Stokes Finn M
	Titolo	Structure of Nucleon Excited States from Lattice QCD / / by Finn M. Stokes
	Pubbl/distr/stampa	Cham : , : Springer International Publishing : , : Imprint : Springer, , 2019
	ISBN	3-030-25722-3
	Edizione	[1st ed. 2019.]
	Descrizione fisica	1 online resource (245 pages)
	Collana	Springer Theses, Recognizing Outstanding Ph.D. Research, , 2190-5053
	Disciplina	539.7548
	Soggetti	Particles (Nuclear physics)
		Quantum field theory
		Physics
		Elementary Particles, Quantum Field Theory
		Numerical and Computational Physics, Simulation
	Lingua di pubblicazione	Inglese
	Formato	Materiale a stampa
	Livello bibliografico	Monografia
	Nota di contenuto	Introduction -- Background -- Centre Clusters in the Yang-Mills Vacuum -- Parity Expanded Variational Analysis -- Form Factors of the Proton and Neutron -- Elastic Form Factors of Nucleon Excitations -- Conclusion -- Bibliography -- Index.
	Sommario/riassunto	Quantum Chromodynamics (QCD) describes the interactions between elementary quarks and gluons as they compose the nucleons at the heart of atomic structure. The interactions give rise to complexity that can only be examined via numerical simulations on supercomputers. This work provides an introduction to the numerical simulations of lattice QCD and establishes new formalisms relevant to understanding the structure of nucleons and their excited states. The research opens with an examination of the non-trivial QCD vacuum and the emergence of "centre domains." The focus then turns to establishing a novel Parity-Expanded Variational Analysis (PEVA) technique solving the important problem of isolating baryon states moving with finite momentum. This seminal work provides a foundation for future calculations of baryon properties. Implementation of the PEVA formalism discloses important systematic errors in conventional

calculations and reveals the structure of nucleon excited states from the first principles of QCD for the first time.
