Sommario/riassunto

In this timely book about the current state of research and practice of emergency management in China, the authors take as their basic premises that we now live in a risk society and that our collective ability to deal with disasters and their aftermath is more important than ever. Set within a multi-disciplinary framework that places risk, disaster and crisis, the three phases of emergency management, on an analytical continuum, and drawing on empirical data obtained through surveys, observations, and interviews, the study not only provides a thorough overview of recent progress in our theoretical understanding of the subject but also offers insights on how scientifically informed policies can improve the way emergency management is done in China.
