Sommario/riassunto   The need for energy is increasing and but the production from
                         conventional reservoirs is declining quickly. This requires an
                         economically and technically feasible source of energy for the coming
                         years. Among some alternative future energy solutions, the most
                         reasonable source is from unconventional reservoirs. As the name
                         "unconventional" implies, different and challenging approaches are
                         required to characterize and develop these resources. This Special Issue
                         covers some of the technical challenges for developing unconventional
                         energy sources from shale gas/oil, tight gas sand, and coalbed
                         methane.
