

1. Record Nr.	UNINA9910412067803321
Titolo	Proceedings of the 2nd ACM SIGSPATIAL International Workshop on GeoSpatial Simulation / / Hamdi Kavak, Joon-Seok Kim, Sarah Wise, editors
Pubbl/distr/stampa	New York, NY : , : Association for Computing Machinery, , 2019
Descrizione fisica	1 online resource (46 pages) : illustrations
Collana	ACM international conference proceedings series
Disciplina	910.285
Soggetti	Geographic information systems
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Sommario/riassunto	<p>Space and distance have long been acknowledged by researchers as fundamental constraints which shape our world. As technological changes have transformed the very concept of distance, the relative location and connectivity of geospatial phenomena have remained stubbornly significant in how systems function. At the same time, however, technology has allowed us to begin to bring tools like simulation to bear on our understanding of how such systems work. While previous generations of scientists and practitioners were unable to gather spatial data or to incorporate it into models at any meaningful scale, new methodologies and data sources are becoming increasingly available to researchers, developers, users, and practitioners. This flowering of different approaches is occurring simultaneously across many fields, and at every point in the research process. Techniques for preparing spatial data for use in simulations, for measuring spatial processes within such simulations, or for using simulations to generate novel spatial data for further research have been developed by practitioners in dozens of distinct disciplines. These parallel lines of study hold great promise for researchers, and suggest the value of explicitly working across research boundaries to adopt and share techniques for the use and preparation of geospatial data in a simulation context.</p>
