	Lingua di pubblicazione	Inglese
	Formato	Materiale a stampa
	Livello bibliografico	Monografia
	Sommario/riassunto	It is our great pleasure to welcome you to the Fifth ACM Workshop on Cyber-Physical Systems Security and PrivaCy (CPS-SPC) in conjunction with the 26th ACM Conference on Computer and Communications Security (CCS) in London, United Kingdom. Our increased dependency on cyber-physical systems (CPS) has amplified concerns of cyber attacks on these systems. These transformative attack methods require additional research into secure control systems and related architectures of CPS. The majority of the published literature addressing the security and privacy of CPS reflect a field that is still developing. As such, the overall principles, models, and theories for securing CPS have not yet emerged. The CPS-SPC workshop series provides a focal point for the research community to begin addressing the security and privacy of CPS in a comprehensive and interdisciplinary manner and, in tandem with other efforts, build a comprehensive research roadmap. As a workshop, we expect to attract papers that reflect new research directions in CPS security and privacy as well as early results based on "works in progress". This year's workshop builds on the foundation laid last year to become one of the premier forums for presentation of interdisciplinary research results and experience reports at the interface of control theory, information security,

embedded and real-time systems and human factors applied to CPS. The mission of the workshop is to create a community of researchers focusing on diverse aspects of CPS Security and Privacy, and to provide researchers and practitioners a premier forum to share their perspectives with others interested in interdisciplinary approaches to solve the challenging security and privacy problems in CPS.
