1. Record Nr.   UNINA9910427684203321

   Autore   Sacha Krzysztof

   Titolo   Time crystals / / Krzysztof Sacha

   Pubbl/distr/stampa Cham, Switzerland : , : Springer, , [2020]
                      ©2020

   ISBN   3-030-52523-6

   Edizione   [1st ed. 2020.]

   Descrizione fisica 1 online resource (XIII, 268 p. 74 illus., 66 illus. in color.)

   Collana   Springer series on atomic, optical, and plasma physics ; ; Volume 114

   Disciplina   548

   Soggetti   Crystals
                      Quantum theory

   Lingua di pubblicazione Inglese

   Formato   Materiale a stampa

   Livello bibliografico Monografia

   Nota di contenuto Chapter 1: Introduction -- Chapter 2: Spontaneous breaking of space
                      translation symmetry -- Chapter 3: Spontaneous breaking of
                      continuous time translation symmetry -- Chapter 4: Discrete time
                      crystals and related phenomena -- Chapter 5: Condensed matter
                      physics in the time dimension -- Chapter 6: Phase space crystals --
                      Chapter 7: Photonic time crystals.

   Sommario/riassunto This book provides the first comprehensive description of time crystals
                      which have a repeating structure in time. It introduces the fundamental
                      concepts behind time crystals and explores the many different
                      branches of this new research area. The book starts with the original
                      idea of the time crystallization in quantum systems as introduced by
                      Wilczek and follows the development of the field up to the present day.
                      Both spontaneous formation of crystalline structures in time and
                      concepts of the condensed matter physics in the time domain, ranging
                      from Anderson localization in time to many-body systems with exotic
                      interactions, are described. The prospect of creation of novel objects by
                      means of time engineering is also presented. The book assumes
                      knowledge of quantum mechanics to the graduate level. It serves as a
                      valuable reference with pointers to future research directions for
                      graduate students and senior scientists alike.
