

1. Record Nr.	UNINA9910437813103321
Titolo	Material designs and new physical properties in MX- and MMX-chain compounds / / Masahiro Yamashita, Hiroshi Okamoto, editors
Pubbl/distr/stampa	Wien ; ; New York, : Springer, c2013
ISBN	1-283-93564-3 3-7091-1317-2
Edizione	[1st ed. 2013.]
Descrizione fisica	1 online resource (274 p.)
Altri autori (Persone)	YamashitaMasahiro OkamotoHiroshi
Disciplina	541/.36 620.11299
Soggetti	Materials - Design
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Description based upon print version of record.
Nota di bibliografia	Includes bibliographical references and index.
Nota di contenuto	pt. 1. MX-chain compounds -- pt. 2. MMX-chain compounds.
Sommario/riassunto	<p>This is the first book to comprehensively address the recent developments in both the experimental and theoretical aspects of quasi-one-dimensional halogen-bridged mono- (MX) and binuclear metal (MMX) chain complexes of Pt, Pd and Ni. These complexes have one-dimensional electronic structures, which cause the various physical properties as well as electronic structures. In most MX-chain complexes, the Pt and Pd units are in M(II)-M(IV) mixed valence or charge density wave (CDW) states due to electron-phonon interactions, and Ni compounds are in Ni(III) averaged valence or Mott-Hubbard states due to the on-site Coulomb repulsion. More recently, Pd(III) Mott-Hubbard (MH) states have been realized in the ground state by using the chemical pressure. Pt and Pd chain complexes undergo photo-induced phase transitions from CDW to MH or metal states, and Ni chain complexes undergo photo-induced phase transitions from MH to metal states. Ni chain complexes with strong electron correlations show tremendous third-order optical nonlinearity and nonlinear electrical conductivities. They can be explained theoretically by using the extended Peierls-Hubbard model. For MMX-chain complexes, averaged valence, CDW, charge polarization, and alternating charge</p>

polarization states have been realized by using chemical modification and external stimuli, such as temperature, photo-irradiation, pressure, and water vapor. All of the electronic structures and phase transitions can be explained theoretically.
