Sommario/riassunto	In this powerful and evocative narrative, Gail Lee Bernstein vividly re-creates the past three centuries of Japanese history by following the fortunes of a prominent Japanese family over fourteen generations. The first of its kind in English, this book focuses on Isami, the eleventh generation patriarch and hereditary village head. Weaving back and forth between Isami's time in the first half of the twentieth century and his ancestors' lives in the Tokugawa and Meiji eras, Bernstein uses family history to convey a broad panoply of social life in Japan since the late 1600's. As the story unfolds, she provides remarkable details and

absorbing anecdotes about food, famines, peasant uprisings, agrarian values, marriage customs, child-rearing practices, divorces, and social networks. Isami's House describes the role of rural elites, the architecture of Japanese homes, the grooming of children for middle-class life in Tokyo, the experiences of the Japanese in Japan's wartime empire and on the homefront, the aftermath of the country's defeat, and, finally, the efforts of family members to rebuild their lives after the Occupation. The author's forty-year friendship with members of the family lends a unique intimacy to her portrayal of their history. Readers come away with an inside view of Japanese family life, a vivid picture of early modern and modern times, and a profound understanding of how villagers were transformed into urbanites and what was gained, and lost, in the process.

Sommariorriassunto	EU energy policy is more and more promoting a resilient, efficient and sustainable energy system. Several agreements have been signed in the last few months that set ambitious goals in terms of energy efficiency and emission reductions and to reduce the energy consumption in buildings. These actions are expected to fulfill the goals negotiated at the Paris Agreement in 2015. The successful development of this ambitious energy policy needs to be supported by scientific knowledge: a huge effort must be made in order to develop more efficient energy conversion technologies based both on renewables and fossil fuels. Similarly, researchers are also expected to work on the integration of conventional and novel systems, also taking into account the needs for the management of the novel energy systems in terms of energy storage and devices management. Therefore, a multi-disciplinary approach is required in order to achieve these goals. To ensure that the scientists belonging to the different disciplines are aware of the scientific progress in the other research areas, specific Conferences are

periodically organized. One of the most popular conferences in this area is the Sustainable Development of Energy, Water and Environment Systems (SDEWES) Series Conference. The 12th Sustainable Development of Energy, Water and Environment Systems Conference was recently held in Dubrovnik, Croatia. The present Special Issue of Energies, specifically dedicated to the 12th SDEWES Conference, is focused on five main fields: energy policy and energy efficiency in smart energy systems, polygeneration and district heating, advanced combustion techniques and fuels, biomass and building efficiency.
