   Nota di bibliografia   Includes bibliographical references and index.

   Sommario/riassunto   DFSMSrmm is the IBM tape management system for OS/390 and z/OS
                            platforms. As part of DFSMS, DFSMSrmm is completely integrated into
                            the IBM storage management strategy. This allows easier installation
                            and maintenance, as well as standard interfaces with other systems
                            components, such as DFSMSdfp and DFSMShsm. DFSMSrmm provides a
                            simple and flexible tape management environment, with support for all
                            tape technologies, including IBM automated tape libraries, manual
                            tapes, and other tape libraries. This IBM Redbooks publication is
                            written for people who are planning to convert from TLMS to
                            DFSMSrmm. We have designed this book to help you with all aspects of
                            the conversion, from the early planning stage through implementation
                            and customization of DFSMSrmm into your production system. We
                            provide details on the differences between DFSMSrmm and TLMS and
                            compare the terminology, data, and functions. We explain how to use
                            the IBM-supplied sample conversion programs and get the converted
                            data validated and ready for use in a production environment. Working
                            samples that are ready for use are included.
