Sommario/riassunto

This paper proposes a new theory of why null-subjects of finite verbs are produced by young children developing a non-null-subject language. We first show that one of the extant theories, Topic-Drop, isn't supported. Modifying ideas proposed in Rizzi (2006), we assume that finite null-subjects arise in the specifier of a root TP, and may be null as the result of phasal computation. But we reject the idea that the selection of a root is an arbitrary, parametric process. Using new work in syntactic theory that relates information structure (namely undistinguished subjects) to root Tense Phrases

| Sommario/riassunto | Examining the overlooked subject of non-disabled siblings in families where there is a disabled child, Brothers and Sisters of Disabled Children details the experiences of these children and explores what it means to them to have a disabled brother or sister. Through family interviews and one-to-one meetings, Peter Burke records siblings' views on issues ranging from the everyday social restrictions on their lives, the discrimination they face at school, through to their concerns about the future. He also considers the difficulties for siblings of finding their own identity in 'disabled' famil |
