

1. Record Nr.	UNINA9910452412303321
Autore	Turchin Peter <1957->
Titolo	Complex population dynamics [[electronic resource] ] : a theoretical/empirical synthesis / / Peter Turchin
Pubbl/distr/stampa	Princeton, N.J., : Princeton University Press, c2003
ISBN	1-4008-4728-1 1-299-13326-6
Edizione	[Course Book]
Descrizione fisica	1 online resource (471 p.)
Collana	Monographs in Population Biology ; ; 35 Monographs in population biology ; ; 35
Classificazione	WI 2100
Disciplina	577.8/8
Soggetti	Population biology Electronic books.
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Description based upon print version of record.
Nota di bibliografia	Includes bibliographical references and index.
Nota di contenuto	pt. 1. Theory -- pt. 2. Data -- pt. 3. Case studies.
Sommario/riassunto	Why do organisms become extremely abundant one year and then seem to disappear a few years later? Why do population outbreaks in particular species happen more or less regularly in certain locations, but only irregularly (or never at all) in other locations? Complex population dynamics have fascinated biologists for decades. By bringing together mathematical models, statistical analyses, and field experiments, this book offers a comprehensive new synthesis of the theory of population oscillations. Peter Turchin first reviews the conceptual tools that ecologists use to investigate population oscillations, introducing population modeling and the statistical analysis of time series data. He then provides an in-depth discussion of several case studies--including the larch budmoth, southern pine beetle, red grouse, voles and lemmings, snowshoe hare, and ungulates--to develop a new analysis of the mechanisms that drive population oscillations in nature. Through such work, the author argues, ecologists can develop general laws of population dynamics that will help turn ecology into a truly quantitative and predictive science. Complex Population Dynamics integrates theoretical and empirical studies into a major new synthesis of current knowledge

about population dynamics. It is also a pioneering work that sets the course for ecology's future as a predictive science.
