3.3 Health Worker Density and Proportion of Assisted Births by Region

Sommario/riassunto

Despite some recent successes in Ghana, further improvements in health outcomes are in part hampered by the lack of skilled service providers, or human resources for health (HRH), particularly in rural areas, where critical health services are needed most. To address the lack of information and guide the development of policies and programs on HRH, *Toward Interventions in Human Resources for Health in Ghana: Evidence for Health Workforce Planning and Results* aims to paint a comprehensive picture of HRH, consolidating new and existing evidence on the stock, distribution, and performance of health workers.
