of biomedical science, medicine, and the other health sciences.

Students in most medical schools, especially in basic science courses, are required to memorize a large number of ""facts,"" facts which may

or may not be relevant to medical practice. Problem-based learning has two fundamental postulates--the learning through problem-solving is much more effective for creating a body of knowledge usable in the future, and that physician skills most important for patients are problem-solving skills, rather than memory skills.
