### Sommario/riassunto

19 October 2009 marked the 400th anniversary of the death of Jacobus Arminius in Leiden. He was esteemed for the way in which he sought a via media between strict Calvinism and a more humanistic variant of Christian belief. However, because of his deviation from mainstream Calvinism, he has also been violently attacked. Was he a pioneer, who enriched the Reformed tradition by opening it towards new horizons, or a heretic, who founded a new tradition, as an alternative to Reformed theology? The day of the death of this remarkable theologian was commemorated with a conference at Leiden University on Arminius, Arminianism, and Europe (9 and 10 October 2009). The main contributions to that conference are collected in this book. The first part contains some essays on the thinking of Arminius himself: the structure of his theology, his relation to Augustine, and to Rome. The second part deals with Arminianism. Was it influenced by Socinianism, as its opponents often claimed? How was it received in Europe: in Germany, Switzerland (Geneva), England, and Ireland? How far did Arminianism prepare the way for the ideals of the Enlightenment, which made its entry later on in the seventeenth century? An extensive iconography of Jacobus Arminius and an annotated bibliography of all his known writings complete, in the third part, this volume.

**Sommario/riassunto**

A comprehensive treatment of ultrafast optics This book fills the need for a thorough and detailed account of ultrafast optics. Written by one of the most preeminent researchers in the field, it sheds new light on technology that has already had a revolutionary impact on precision frequency metrology, high-speed electrical testing, biomedical imaging, and in revealing the initial steps in chemical reactions. Ultrafast Optics begins with a summary of ultrashort laser pulses and their practical applications in a range of real-world settings. Next, it reviews important background material, including an introduction to Fourier series and Fourier transforms, and goes on to cover: . Principles of mode-locking . Ultrafast pulse measurement methods . Dispersion and dispersion compensation . Ultrafast nonlinear optics: second order . Ultrafast nonlinear optics: third order . Mode-locking: selected advanced topics . Manipulation of ultrashort pulses . Ultrafast time-resolved spectroscopy . Terahertz time-domain electromagnetics Professor Weiner's expertise and cutting-edge research result in a book that is destined to become a seminal text for engineers, researchers, and graduate students alike.
