Sommario/riassunto

With a focus on functional relationships between drugs and their targets, this book covers basic and general pharmacology, from a cellular and molecular perspective, with particular attention to the mechanisms of drug action - the fundamental basis for proper clinical use- without neglecting clinical application, toxicology and pharmacokinetics. Covers cell and molecular pharmacology, bringing together current research on regulation of drug targets, at a level appropriate for advanced undergrad and graduate students Discusses the relevance of pharmacokinetics and drug development
