Sommario/riassunto

One of the most well-established relationships in the economics of aging is that between health and wealth. Yet this relationship is also changing in conjunction with a rapidly aging population as well as a broad evolution in how people live later in life. Building on findings from earlier editions in this National Bureau of Economic Research series, *Investigations in the Economics of Aging* focuses on the changing financial circumstances of the elderly and the relationship of these circumstances to health and health care. Among the topics addressed are the significance of out-of-pocket health care costs, the effects of inflation on social security, and the impact of the recent financial crisis on Americans' well-being. Encompassing new data and advances in research methodology, the developments presented in this volume will have important implications for economies worldwide.
