Sommario/riassunto

Many empirical studies of banking crises have employed ""banking crisis"" (BC) indicators constructed using primarily information on government actions undertaken in response to bank distress. We formulate a simple theoretical model of a banking industry which we use to identify and construct theory-based measures of systemic bank shocks (SBS). Using both country-level and firm-level samples, we show that SBS indicators consistently predict BC indicators based on four major BC series that have appeared in the literature. Therefore, BC indicators actually measure lagged government responses to system
