## Sommario/riassunto

Remittance flows appear to be falling worldwide for the first time in decades as a result of the ongoing financial turmoil. It is suspected that the drop in remittance income into developing and emerging markets will have a destabilizing effect on these economies. The paper estimates the impact of remittances on output stability for countries that are dependent on these income flows. Using a sample of 70 countries, including 16 advanced economies and 54 developing countries, we find robust evidence that remittances have a negative effect on output growth volatility of recipient countries.
