[Sommario/riassunto](#)

Since entering the stage, Davidsonian event arguments have taken on a central role in linguistic theorizing. Recent years have seen a continuous extension of possible applications for them, not only in semantics but also in syntax. At the same time questions concerning the ontological status of events have received renewed attention. This collection of articles provides new evidence for the virtually ubiquitous presence of event arguments in linguistic structure and sheds new light on their nature. The volume is organized into four sections: Events - states - causation; Event nominals; Events in composition; Measuring events.
