| Sommario/riassunto | "The Cold War and decolonization transformed the twentieth century world. This volume brings together an international line-up of experts to explore how these transformations took place and expand on some of the latest threads of analysis to help inform our understanding of the links between the two phenomena. The book begins by exploring ideas of modernity, development, and economics as Cold War and postcolonial projects and goes on to look at the era's intellectual history and investigate how emerging forms of identity fought for supremacy. Finally, the contributors question ideas of sovereignty and state control that move beyond traditional Cold War narratives. Decolonization and the Cold War emphasizes new approaches by drawing on various methodologies, regions, themes, and interdisciplinary work, to shed new light on two topics that are increasingly important to historians of the twentieth century."-- |

Sommario/riassunto	A proof is a successful demonstration that a conclusion necessarily follows by logical reasoning from axioms which are considered evident

for the given context and agreed upon by the community. It is this concept that sets mathematics apart from other disciplines and distinguishes it as the prototype of a deductive science. Proofs thus are utterly relevant for research, teaching and communication in mathematics and of particular interest for the philosophy of mathematics. In computer science, moreover, proofs have proved to be a rich source for already certified algorithms. This book provides the reader with a collection of articles covering relevant current research topics circled around the concept 'proof'. It tries to give due consideration to the depth and breadth of the subject by discussing its philosophical and methodological aspects, addressing foundational issues induced by Hilbert's Programme and the benefits of the arising formal notions of proof, without neglecting reasoning in natural language proofs and applications in computer science such as program extraction.
