

1. Record Nr.	UNINA9910483044903321
Autore	Guruswami Venkatesan
Titolo	List Decoding of Error-Correcting Codes [[electronic resource]] : Winning Thesis of the 2002 ACM Doctoral Dissertation Competition // by Venkatesan Guruswami
Pubbl/distr/stampa	Berlin, Heidelberg : , : Springer Berlin Heidelberg : , : Imprint : Springer, , 2005
ISBN	3-540-30180-1
Edizione	[1st ed. 2005.]
Descrizione fisica	1 online resource (XX, 352 p.)
Collana	Lecture Notes in Computer Science, , 0302-9743 ; ; 3282
Classificazione	54.10
Disciplina	005.7/2
Soggetti	Data structures (Computer science) Coding theory Information theory Algorithms Computers Computer science—Mathematics Data Structures and Information Theory Coding and Information Theory Algorithm Analysis and Problem Complexity Models and Principles Discrete Mathematics in Computer Science
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	"Revised version of [the author's] doctoral dissertation, written under the supervision of Madhu Sudan and submitted to MIT in August 2001" --P. xi.
Nota di bibliografia	Includes bibliographical references (p. [337]-347) and index.
Nota di contenuto	1 Introduction -- 1 Introduction -- 2 Preliminaries and Monograph Structure -- I Combinatorial Bounds -- 3 Johnson-Type Bounds and Applications to List Decoding -- 4 Limits to List Decodability -- 5 List Decodability Vs. Rate -- II Code Constructions and Algorithms -- 6 Reed-Solomon and Algebraic-Geometric Codes -- 7 A Unified Framework for List Decoding of Algebraic Codes -- 8 List Decoding of Concatenated Codes -- 9 New, Expander-Based List Decodable Codes -- 10 List Decoding from Erasures -- III Applications -- Interlude -- III Applications -- 11 Linear-Time Codes for Unique Decoding -- 12

Sommario/riassunto

How can one exchange information effectively when the medium of communication introduces errors? This question has been investigated extensively starting with the seminal works of Shannon (1948) and Hamming (1950), and has led to the rich theory of "error-correcting codes". This theory has traditionally gone hand in hand with the algorithmic theory of "decoding" that tackles the problem of recovering from the errors efficiently. This thesis presents some spectacular new results in the area of decoding algorithms for error-correcting codes. Specifically, it shows how the notion of "list-decoding" can be applied to recover from far more errors, for a wide variety of error-correcting codes, than achievable before. A brief bit of background: error-correcting codes are combinatorial structures that show how to represent (or "encode") information so that it is resilient to a moderate number of errors. Specifically, an error-correcting code takes a short binary string, called the message, and shows how to transform it into a longer binary string, called the codeword, so that if a small number of bits of the codeword are flipped, the resulting string does not look like any other codeword. The maximum number of errors that the code is guaranteed to detect, denoted d , is a central parameter in its design. A basic property of such a code is that if the number of errors that occur is known to be smaller than $d/2$, the message is determined uniquely. This poses a computational problem, called the decoding problem: compute the message from a corrupted codeword, when the number of errors is less than $d/2$.
