1. Record Nr. UNINA9910483245103321

Autore	Brémaud Pierre
Titolo	Markov Chains : Gibbs Fields, Monte Carlo Simulation and Queues / / by Pierre Brémaud
Pubbl/distr/stampa	Cham : , : Springer International Publishing : , : Imprint : Springer, , 2020
ISBN	3-030-45982-9
Edizione	[2nd ed. 2020.]
Descrizione fisica	1 online resource (564 pages)
Collana	Texts in Applied Mathematics, , 0939-2475 ; ; 31
Disciplina	519.233
Soggetti	Probabilities Operations research Decision making Electrical engineering Probability Theory and Stochastic Processes Operations Research/Decision Theory Electrical Engineering
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Nota di bibliografia	Includes bibliographical references and index.
Nota di contenuto	Preface -- 1 Probability Review -- 2 Discrete-Time Markov Chains -- 3 Recurrence and Ergodicity -- 4 Long-Run Behavior -- 5 Discrete-Time Renewal Theory -- 6 Absorption and Passage Times -- 7 Lyapunov Functions and Martingales -- 8 Random Walks on Graphs -- 9 Convergence Rates -- 10 Markov Fields on Graphs -- 11 Monte Carlo Markov Chains -- 12 Non-homogeneous Markov Chains -- 13 Continuous-Time Markov Chains -- 14 Markovian Queueing Theory -- Appendices -- Bibliography -- Index.
Sommario/riassunto	This 2nd edition is a thoroughly revised and augmented version of the book with the same title published in 1999. The author begins with the elementary theory of Markov chains and very progressively brings the reader to more advanced topics. He gives a useful review of probability, making the book self-contained, and provides an appendix with detailed proofs of all the prerequisites from calculus, algebra, and number theory. A number of carefully chosen problems of varying difficulty are proposed at the close of each chapter, and the

mathematics is slowly and carefully developed, in order to make self-study easier. The book treats the classical topics of Markov chain theory, both in discrete time and continuous time, as well as connected topics such as finite Gibbs fields, nonhomogeneous Markov chains, discrete-time regenerative processes, Monte Carlo simulation, simulated annealing, and queuing theory. The main additions of the 2nd edition are the exact sampling algorithm of Propp and Wilson, the electrical network analogy of symmetric random walks on graphs, mixing times and additional details on the branching process. The structure of the book has been modified in order to smoothly incorporate this new material. Among the features that should improve reader-friendliness, the three main ones are: a shared numbering system for the definitions, theorems and examples; the attribution of titles to the examples and exercises; and the blue highlighting of important terms. The result is an up-to-date textbook on stochastic processes. Students and researchers in operations research and electrical engineering, as well as in physics and biology, will find it very accessible and relevant.
