Sommario/riassunto

The second edition of this practical guide offers a comprehensive summary of the most important and most immediate therapeutic approaches in the assessment and treatment of burn injuries. Taking into account age-specific needs in pediatric, adult, and elderly burn patients, several chapters on key issues – such as pre-hospital treatment, wound care and infection control, burn nursing, critical care, burn reconstructive surgery and rehabilitation for burn victims – have now been updated. In addition, the book has been supplemented with the latest information on fluid resuscitation, organ support for burn patients, necrotizing soft tissue infections, and TEN/SJS. Written in a concise manner, the updated edition of this book provides essential guidelines for optimal care to improve patient outcomes, and thus will be a valuable reference resource for physicians, surgeons, residents, nurses, and other burn care providers.
