

1. Record Nr.	UNINA9910483545803321
Titolo	Programming multi-agent systems : 7th International Workshop, ProMAS 2009, Budapest, Hungary, May 10-15, 2009 : revised selected papers // Lars Braubach, Jean-Pierre Briot, John Thangarajah (eds.)
Pubbl/distr/stampa	Berlin, : Springer, 2010
ISBN	1-280-38819-6 9786613566119 3-642-14843-3
Edizione	[1st ed. 2010.]
Descrizione fisica	1 online resource (XII, 285 p. 57 illus.)
Collana	Lecture notes in computer science. Lecture notes in artificial intelligence, , 0302-9743 ; ; 5919 LNCS sublibrary. SL 7, Artificial intelligence
Altri autori (Persone)	BraubachLars BriotJean-Pierre ThangarajahJohn
Disciplina	006.3
Soggetti	Intelligent agents (Computer software) Multiagent systems
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Bibliographic Level Mode of Issuance: Monograph
Nota di bibliografia	Includes bibliographical references and index.
Nota di contenuto	1. Communication models -- 2. Formal models -- 3. Organizations and environments -- 4. Analysis and debugging -- 5. Agent architectures -- 6. Applications.
Sommario/riassunto	The earliest work on agents may be traced at least to the first conceptualization of the actor model by Carl Hewitt. In a paper in an AI conference in the early 1970s, Hewitt described actors as entities with knowledge and goals. Research on actors continued to focus on AI with the development of the Sprites model in which a monotonically growing knowledge base could be accessed by actors (inspired by what Hewitt called "the Scientific Computing Metaphor"). In the late 1970s and well into the 1980s, controversy raged in AI between those arguing for declarative languages and those arguing for procedural ones. Actor researchers stood on the side of a procedural view of knowledge, arguing for an open systems perspective rather than the closed world hypothesis necessary for a

logical, declarative view. In the open systems view, agents had arms-length relationships and could not be expected to store consistent facts, nor could the information in a system be considered complete (the “negation as failure” model). Subsequent work on actors, including my own, focused on using actors for general purpose concurrent and distributed programming. In the late 1980s, a number of actor languages and frameworks were built. These included Act++ (in C++) by Dennis Kafura and Actalk (in Smalltalk) by Jean-Pierre Briot. In recent times, the use of the Actor model, in various guises, has proliferated as new parallel and distributed computing platforms and applications have become common: clusters, Webservicees, P2P networks, client programming on multicore processors, and cloud computing.
