Sommario/riassunto	This book explores the relationships between the energy costs and other farm variables in the European Union (including the UK) over a

recent period of six years. It examines labour, farm land area, outputs/inputs, investments, assets, taxes, and subsidies in the context of policy measures and the farm structure. The book provides a deep insight into how energy cost and other factors in the farming sector relate to each other and as a result how farm planning can be made more efficient, more environmentally sustainable and more competitive. It will be of interest to policy-makers, governments, researchers and advanced students of economics, policy and the environment.
