Sommario/riassunto

Ce volume est un état de la recherche internationale sur les socialismes africains. Y sont rassemblés des articles traitant de débats théoriques autour de ce thème et de ses sources intellectuelles mais aussi d'expériences très concrètes de socialisme, tant dans les villes que dans les campagnes : coopératives, comités de quartier, camps de rééducation... La situation de l'Afrique lusophone, parent pauvre des études africaines en France, et dont l'ensemble des pays ont justement fait l'expérience de régimes socialistes, a fait l'objet d'une attention particulière. Les rapports de l'Afrique avec l'URSS, les démocraties populaires, Cuba, la Chine, ou encore Israël sont également abordés. Les communications faites dans les colloques ont été repensées, avec pour résultat un fructueux dialogue avec les auteur.e.s et des articles complémentaires. Les auteurs espèrent ainsi donner à l'étude des socialismes africains une légitimité dans le champ plus général de l'histoire des socialismes, de même que dans celui de celle de la guerre froide. This book provides an overview of international research on socialism in Africa. It brings together theoretical debates about the forms of socialism found in Africa, their intellectual roots, as well as concrete experiences, both in cities and in the countryside, from cooperatives, neighborhood committees to reeducation camps and more. It also covers Africa's relations with the Soviet Union, the People's Democracies, Cuba, China, and Israel. The authors set out to give the study of African socialism a place in the more general field of the history of socialism, as well as in that of the Cold War.

Nota di bibliografia	Includes bibliographical references.
Nota di contenuto	Chapter 1. An introduction to almond species and their origins -- Chapter 2. Almond species classification -- Chapter 3. Characteristics of almond species -- Chapter 4. Identification of almond species by using markers -- Chapter 5. Self-incompatibility of almond species -- Chapter 6. Seed germination of almond species -- Chapter 7. Almond species traditional utilization -- Chapter 8. Enrichment of Breeding Germplasm.
Sommario/riassunto	Almond and peach species have global importance as food crops as well as use in landscaping including restoration and reforestation. Because currently available breeding germplasm has a very narrow genetic base, genetic improvement programs are turning to wild germplasm as sources of improved quality, productivity and resistance traits. This germplasm is also enabling the dramatic modification of

traditional cropping systems as with the transfer of self-fruitfulness from related wild almond and peach species to normally self-sterile cultivated almond. While presence of an extensive wild almond and related germplasm has been documented in the literature over the past century, most information remains dispersed and often not generally accessible owing to its publication in treatises and journals of limited distribution. This monograph brings together a comprehensive characterization of almond and its related species including the cultivated and wild peaches. Because it represents the only comprehensive source of information on almond, peach and their wild relatives, it represents a basic reference text of interest to researchers in both the basic and applied plant and ecological sciences.
