Sommario/riassunto

In this book, John Bowman provides an introduction to the Dewey
 Decimal Classification suitable either for beginners or for librarians who
 are out of practice using Dewey. He outlines the content and structure
 of the scheme and then, through worked examples using real titles,
 shows readers how to use it. Most chapters include practice exercises,
 to which answers are given at the end of the book. A particular feature
 of the book is the chapter dealing with problems of specific parts of the
 scheme. Later chapters offer advice on how to cope with compound
 subjects, and a brief introduction to the Web version of Dewey. Written
 in an engaging and direct style, this text is a companion volume both
 to the author's own bestselling *Essential Cataloguing* and to Vanda
 Broughton's *Essential Classification*. It is ideal for library students, and
 for public, school and solo librarians and classifiers who are just
 beginning to use Dewey and need some simple examples.
