Note generali	Revised thesis.
Nota di bibliografia	Includes bibliographical references.
Sommario/riassunto	Entre le début de notre ère et les années 260, l'appartenance à une association professionnelle, culturelle ou funéraire a présidé à la définition du rang social de nombreux habitants de l'Italie et des Gaules romaines. Aussi ce livre porte-t-il au jour la place que les membres des associations romaines, les collegiati, occupaient dans leurs sociétés. L'appartenance à un collège faisait naître un sentiment de respectabilité, et permettait parfois d'acquérir un réel prestige. Cette respectabilité et ce prestige résultaient de l'insertion des associations dans les cités : le rang de collegiatus était de nature civique. L'association correspondait à l'un des groupes dans lesquels les collegiati nouaient des relations interpersonnelles, et l'interaction de ces multiples appartenances déterminait leur position sociale. Toutefois, le rang des collegiati, tel qu'il apparaît dans les sources disponibles, n'est

pas une donnée objective. Il est au centre d'un discours épigraphique construit par les collegiati eux-mêmes. Les membres des associations se plaisaient à décrire leurs destinées comme des réussites. Cependant, leurs discours comportent des omissions, et des pans bien choisis du réel côtoient fréquemment l'exagération, la métaphore ou le fantasme.

Sommario/riassunto	Even in ancient times, semi-solid preparations for cutaneous application, popularly known as ointments, played an important role in human society. An advanced scientific investigation of "ointments" as dosage forms was initiated in the 1950s. It was only from then on that the intensive physico-chemical characterization of ointments as well as the inclusion of dermatological aspects led to a comprehensive understanding of the various interactions between the vehicle, the active ingredient and the skin. From then on, many researchers were involved in optimizing semi-solid formulations with respect to continuously changing therapeutic and patient needs. Aspects that have been dealt with were the optimization of dermatobiopharmaceutical properties and many different issues related to patient compliance, such as skin tolerance, applicability, and cosmetic appeal. Moreover, processing technology has been improved and analytical techniques were developed and refined in order to enable the improved characterization of the formulation itself as well as its

interaction with the skin. This Special Issue serves to highlight and capture the contemporary progress and current research on semi-solid formulations as dermal drug delivery systems. We invite articles on all aspects of semi-solid formulations, highlighting the research currently undertaken to improve and better understand these complex drug delivery systems with respect to their formulation, processing and characterization issues.
