| Sommario/riassunto      | This book represents the efforts of different authors to analyze and<br>provide solid evidence that supports training regulations based on<br>monitoring strategies. This Special Issue includes original articles with<br>some diversity, i.e., considering that different age groups, competitive<br>levels, expertise, and conditions were researched regarding the main<br>topics of training load and performance monitoring, recovery,<br>wellbeing, and illness and injury prevention. Psychophysiological<br>aspects were considered, as were locomotor and mechanical demands<br>and tactical responses. The myriad outcomes analyzed present the<br>reader with an overview of the state of the art and possible new<br>directions for future research. In this book, readers will be also able to<br>find systematic reviews about the key topics. |
