

1. Record Nr.	UNINA9910576891503321
Autore	Straessner Arno
Titolo	Electroweak physics at LEP and LHC // Arno Straessner
Pubbl/distr/stampa	Berlin, Heidelberg, : Springer Nature, 2010 Berlin : , : Springer, , [2010] ©2010
ISBN	1-282-92874-0 9786612928741 3-642-05169-3
Edizione	[1st ed. 2010.]
Descrizione fisica	1 online resource (220 p.)
Collana	Springer tracts in modern physics ; ; Volume 235
Disciplina	539.7544
Soggetti	Electroweak interactions Electroweak interactions - Data processing Large Hadron Collider (France and Switzerland) Higgs bosons Standard model (Nuclear physics)
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Description based upon print version of record.
Nota di bibliografia	Includes bibliographical references and index.
Nota di contenuto	Theoretical Framework -- The LEP Experiments -- Gauge Boson Production at LEP -- Electroweak Measurements and Model Analysis Of Electroweak Data -- The ATLAS and CMS Experiments at the LHC -- Expectations for Electroweak Measurements at the LHC -- Higgs Physics at the LHC -- Summary and Conclusion.
Sommario/riassunto	During more than 10 years, the LEP accelerator and the LEP experiments have taken data for a large amount of measurements at the frontier of particle physics. The main outcome is a thorough and successful test of the Standard Model of electroweak interactions. The first part of this volume gives a short theoretical introduction and describes the most important physics results obtained at LEP. Emphasis is put on the properties of the electroweak gauge bosons, which was the main research field at LEP. Details on interesting other physics effects like Colour Reconnection and Bose-Einstein Correlations are discussed as well. A summary of the current electroweak

measurements as the pillars of precision tests of theoretical models is given. The analysis of electroweak data concludes the status of electroweak physics as known today. It allows a determination of unmeasured physics parameters of the Standard Model, like the mass of the Higgs boson, but constrains also physics beyond the Standard Model. The second part of this volume introduces the expected electroweak measurements as well as Higgs boson searches at the newly built LHC. After a description of the LHC collider and its experiments, the projected performance for an improved determination of electroweak observables is presented. The masses of the W boson and of the top quark as well as the weak mixing angle are being focused on. One of the main goals of the LHC experiments is however the finding of the Standard Model Higgs boson or of new physics. The search for the Higgs boson and the future determination of its properties, like mass, spin and behaviour under CP transformation, are therefore summarized, pointing out interesting relations with the LEP results. If the LHC experiments meet the expectations presented here they will definitely shed light on one of the primary questions of today's particle physics research: the origin of electroweak symmetry breaking and of the masses of the fundamental particles.
