Sommario/riassunto	Natural compounds, from terrestrial and marine sources, are the result of an evolutionary process which originated in compounds with great structural diversity, multiple biological activities and miscellaneous applications. A large and very active research field is dedicated to identifying biosynthesized compounds; to improve/develop new methodologies to produce/reuse natural compounds; to assess their potential; and to understand their mechanism of action. This Special Issue brings together excellent original and review works, focused on the most recent advances related to the secondary metabolites' composition of natural sources, and the proposal of new applications for their constituents, such as therapeutic agents, and pesticides or food ingredients.

Sommario/riassunto	"Though Cannan, in his early years as an economist, was a critic of classical economics and an ally of interventionists, he moved sharply to the side of classical liberalism in the early 20th century. In this book, originally published in 1929 Edwin Cannan discussed in comparative terms the general problems of economics and in particular the theories of production, value and distribution and the attempts that had been made to solve them. Examining key principles of economics in historical terms, the author draws his own conclusions only after a full discussion of various viewpoints. "--Provided by publisher.
