Sommario/riassunto

This unique book presents for the first time the current status of the Danube River Delta, the challenges facing it, and proposed strategies to solve it. One of the biggest challenges is the human effects on the Danube Delta Environment and its lakes that work as sinks for natural and anthropogenic environmental changes, the water management and water flow variability and under climatic conditions including the extreme temperature and precipitation events based on RCMs output and the impact of sedimentation processes on the evolution of the Danube Delta. The book also contains the impact of wind and solar energy on the Delta. The book also presents the integrated approach for sustainable development of the Delta including the structural dynamics of the local economy, the role of tourism activities, integrated waste management in the Danube Delta Biosphere Reserve, demographic dynamics in the Delta, and the population health state. Also, a unique chapter on the opportunities of content exploitation as Language Learning Experiences is applied to Danube Delta. The book will be of great scientific interest to help the graduate students, researchers, stakeholder professional engineers, policy planners, policymakers of three countries to implement their sustainable development plan.
