Sommario/riassunto

The Palgrave Handbook of the History of Human Sciences offers a uniquely comprehensive and global overview of the evolution of ideas, concepts and policies within the human sciences. Drawn from histories of the social and psychological sciences, anthropology, the history and philosophy of science, and the history of ideas, this collection analyses the health and welfare of populations, evidence of the changing nature of our local communities, cities, societies or global movements, and studies the way our humanness or 'human nature' undergoes shifts because of broader technological shifts or patterns of living. This Handbook serves as an authoritative reference to a vast source of representative scholarly work in interdisciplinary fields, a means of understanding patterns of social change and the conduct of institutions, as well as the histories of these 'ways of knowing' probe the contexts, circumstances and conditions which underpin continuity and change in the way we count, analyse and understand ourselves in our different social worlds. It reflects a critical scholarly interest in both traditional and emerging concerns on the relations between the biological and social sciences, and between these and changes and continuities in societies and conducts, as 21st century research moves into new intellectual and geographic territories, more diverse fields and global problematics.
