Sommario/riassunto	<p>This book investigates the relationship between the character of political regimes in Russia's subnational regions and the structure of earnings and income. Based on extensive data from Russian official sources and surveys conducted by the World Bank, the book shows that income inequality is higher in more pluralistic regions. It argues that the relationship between firms and government differs between more democratic and more authoritarian regional regimes. In more democratic regions, business firms and government have more cooperative relations, restraining the power of government over business and encouraging business to invest more, pay more and report more of their wages. Average wages are higher in more democratic regions and poverty is lower, but wage and income inequality are also higher. The book argues that the rising inequality in postcommunist Russia reflects the inability of a weak state to carry out a redistributive social policy.</p>

Sommario/riassunto

These thirteen papers and accompanying commentaries are the first fruits of an ongoing research project that has concentrated on developing simulation models that incorporate the behavioral responses of individuals and businesses to alternative tax rules and rates and on expanding computational general equilibrium models that analyze the long-run effects of changes on the economy as a whole. The principal focus of the project has been on the microsimulation of individual behavior. Thus, this volume includes studies of individual responses to an over reduction in tax rates and to changes in the highest tax rates; a study of alternative tax treatments of the family; and studies of such specific aspects of household behavior as tax treatment of home ownership, charitable contributions, and individual saving behavior. Microsimulation techniques are also used to estimate the effects of alternative policies on the long-run financial status of the social security program and to examine the effects of alternative tax rules on corporate investment and of foreign-source income on overseas investment. The papers devoted to the development of general equilibrium simulation models to include an examination of the implications of international trade and capital flows, a study of the effects of capital taxation that uses a closed economy equilibrium model, and an examination of the effect of switching to an inflation-indexed tax system. In the volume's final paper, a life-cycle model in which individuals maximize lifetime utility subject to a lifetime budget constraint is used to simulate the effects of tax rules on personal savings.
