Sommario/riassunto	<p>Germanium (Ge) chalcogenides are characterized by unique properties that make these materials interesting for a very wide range of applications from phase change memories to ovonic threshold switches and from photonics to thermoelectric and photovoltaic devices. In many cases, their physical properties can be finely tuned by doping or by changing the amount of Ge, which may therefore play a key role in determining the applications, performance, and even the reliability of these devices. In this book, we include 11 articles, mainly focusing on applications of Ge chalcogenides for non-volatile memories. Most of the papers have been produced with funding received from the European Union's Horizon 2020 Research and Innovation program under grant agreement n. 824957. In the Special Issue "BeforeHand: Boosting Performance of Phase Change Devices by Hetero- and Nanostructure Material Design", two contributions are related to the prototypical Ge<sub>2</sub>Sb<sub>2</sub>Te<sub>5</sub> compound, which is the most studied composition, already integrated in many devices such as optical and electronic memories. Five articles focus on Ge-rich GeSbTe alloys, exploring the electrical and the structural properties, as well as the decomposition paths. Other contributions are focused on the effect of the interfaces and on nanowires.</p>

Sommario/riassunto	After 1945, the Soviet secret services made a significant contribution to the formation of the GDR along Soviet lines. Mass arrests and ""purges"" accompanied the activities of the military branches of the NKVD-MVD and MGB. This source work, opening with a well-researched introduction to the historical context, is the first in the German language to examine the role of the Soviet secret police in the Soviet occupied zone and subsequently the GDR. Documented are the NKVD-MGB's formation, field of activity and daily routines.
