                             Agroforestry systems

   Lingua di pubblicazione   Inglese

   Formato   Materiale a stampa

   Livello bibliografico   Monografia

   Sommario/riassunto   This book focuses on the potential of agroforestry to maximize
                             agriculture production while minimizing negative effects on the
                             environment. It collects several studies on agroforestry systems from
                             around the world, including a variety of types of agroforestry systems,
                             from traditional wood-pastures to tropical cocoa-based systems, and
                             research approaches, from literature reviews to state-of-the-art
                             ecological-economic models. The book highlights the potential of
                             agroforestry as a promising approach for the creation of
                             multifunctional landscapes able to face contemporary environmental
                             challenges.
